

## AFL Installs Data and Fiber Cable Infrastructure

### Summary

AFL provided data and fiber installation and buildout for a retail branch and office building for Wells Fargo Bank in downtown Jacksonville FL.

### Challenge

Wells Fargo posted this project for open bid and competition was fierce. AFL has had a long relationship with Wells Fargo and had first-hand knowledge of this building through a previous project. Wells Fargo awarded AFL the Jacksonville Tower project as a result of AFL's experience, expertise and track record for the previous project.

### Solution

AFL installed 275 dual drops in four floors of the Wells Fargo Bank Jacksonville Tower building. The project included the buildout of four intermediate distribution frames (IDFs) and one main distribution frame (MDF). AFL also provided data and fiber drops for a retail branch in the same building as part of the overall upfit.

### Results

This project was part of the conversion of Wachovia facilities to the Wells Fargo brand and system. The IDF rooms allow Wells Fargo IT department to manage connectivity and networking equipment on each of the four floors. AFL's delivery of quality data and fiber installation work ensures an efficient conversion of Wachovia to Wells-Fargo.

*AFL completes work in one of four IDF rooms by testing data and fiber cables that will connect workstations to the Wells Fargo network.*
